

Locus of Control

Name: _____

Date: _____

Instructions

We blame ourselves all the time, for things we are responsible for, and otherwise. We often have a biased view of what or who is responsible for what happens in our lives. We are prone to the *Fundamental Attribution Error*, meaning that we often give more importance to internal factors as compared to environmental or situational factors. In order to have an objective view of life, you need to look at both sides.

The Locus of Control Worksheet will help you explore factors that contribute to a specific problem or behavior in your life. This exercise will help you break down these influences into two key categories: **Internal Factors** and **External Related Factors**. By doing so, you'll gain a better understanding of how you perceive your role and the role of others in your situation.

Internal Factors:

These are factors related to yourself. You can call these dispositional factors as well, or factors related to your personality. Internal factors help you understand to what extent you, as a person, are responsible for the situation or behavior.

External Factors:

These are factors outside of yourself. You either have no control over them or incomplete control over them. For example, *introversion*, as a personality trait, is something that's outside a person's control. Introverts are just simply not comfortable around other people.

This self-awareness exercise will enable you to determine whether you tend to attribute the issue more to your own actions and choices (internal locus of control) or external factors and outside influences (external locus of control). Ultimately, this exercise empowers you to make more informed decisions for personal growth and resolving challenges.

Here's how this worksheet works:

- **Define the Problem**

Begin by clearly defining the specific problem or behavior you want to analyze. This could be a personal challenge, a habit, or any situation you're trying to understand better.

- **Write Internal and External Factors**

Write down both the internal and external factors as explained above.

- **Analyze Control**

Rate how much control, objectively, do you have over each factors. Rate from 1 to 10, with 1 indicating the least amount of control and 10 indicating full control. Control in this context refers to your ability to change that factor.

Define the Problem			
Internal Factors	Control over Internal Factors (1 to 10)	External Factors	Control Over External Factors (1 to 10)

Reflect and Analyze

Think about what you learned from this exercise. Examine the patterns that emerge from your categorization of factors. Are you attributing the problem more to internal or external factors? This analysis can provide valuable insight into your locus of control. After analyzing the patterns, ask yourself: Is there anything you can do about the problems associated with yourself? If YES, list 5 things you can do to that can make your situation better.
